Let's Start!

Data Warehouses for Managerial Decisions

Learning Outcome:

Designs the data structure based on the database structures and its characteristics.

Understand the concept of data warehouse, its components and characteristics.

Can Do Statements:

- I can tell what a data warehouse is.
- I can talk about the data warehouse main features.
- I can describe the different types of data warehouse.

Ask your partner:

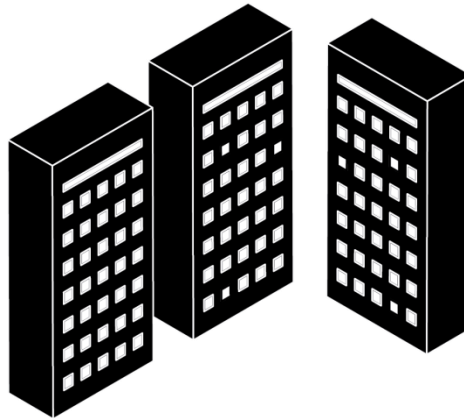

- Where do you think CEOs keep information for managerial decisions?
- Do you think it is important for a manager to get access to information easily for managerial decisions? Why?

Let's Explore!

Finding out What Data Warehouses Are

Instructions: Read the text below.

- Jaime:** Good morning, Sean. Does the meeting start at 8:30? Are you leaving already?
- Sean:** Hi! Yes, it does. I'll leave in a few minutes. Is there anything you need?
- Jaime:** Hmm, will you help me with something, please? I talked to the boss, and he asked me to find information about data warehouses. Do you know what those are?
- Sean:** Sure, I'll explain it to you.
- Jaime:** Great! I'd better take notes, then.
- Sean:** Look, a data warehouse is a database designed for analysis, not for real-time business operations. It works with bulk loads and large queries, and it helps to understand information throughout time in a given company.
- Jaime:** I see. Do you know what its main features are? I ought to get informed about it.
- Sean:** OK, then. A data warehouse has some features: it's subject-oriented, integrated, time variant and non-volatile. In other words, you can define data by subject; the information appears in a consistent format, and it is used based on specific chunks of time. The information in the data warehouse does not change once is entered. Remember, a data houseware helps managers make decisions.
- Jaime:** Perfect. What else do you think I need to know?
- Sean:** Well, you might want to know that there are different types of data warehouses. Do you need to hand in this information today?
- Jaime:** Oh, I'm afraid so. Does the boss leave in the afternoon?
- Sean:** Yes, he does. Anyway, there are three different types of data warehouses. The first one is about information processing; it basically processes information by statistical analysis, charts, or graphs. The second one is about analytical processing; it supports analytical processing of information by Online Analytical Processing operations. The third one is data mining; it can discover knowledge by finding hidden patterns. This one can even show findings in a visual way.
- Jaime:** Wow. All information I've collected is going to help me understand if this is the solution our boss is looking for.

Let's Practice!

There are some questions you need to answer about a data warehouse.

Instructions: Read the sentences. Write the missing words. Use: is, keep, going to, helping, work for.

1. What is a data warehouse _____ do for our company?
2. Will a data warehouse _____ analysis purposes?
3. Is a data warehouse _____ us organize information from different sources once we start using it?
4. What _____ our manager going to do with a data warehouse?
5. Will the information we enter in the data warehouse _____ the same?

Let's Practice!

Can you recall* information about the features of a data warehouse?

*To "recall" means to remember something.

Instructions: Match column A with Column B.

COLUMN A

1. I'd better write
2. You' d better understand the main
3. You might want to
4. you might want to know that there are different
5. You ought to know what
6. You'd

COLUMN B

- a. better think time variant as information used based on specific chunks of time.
- b. down some insights about data warehouse.
- c. features of a data warehouse.
- d. know that integrated information has to do with keeping a consistent format.
- e. non-volatile means.
- f. types of data warehouses.

Extension Activity

How can a data warehouse help a company? Think about the way a data warehouse can contribute to a company.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- List the reasons a company needs a data warehouse for analysis. Write sentences using *had better*, *ought to*, or *might want to*.
- Research on the main features of a data warehouse in relation to a company you know.
- Write some ideas about the future of a company. Use *be going to* and *will* in your sentences.
- Share your ideas with a partner.

Self-Assessment

Yes

No

- I talk about the reasons to consider a data warehouse.
- I present information about the features of a data warehouse.
- I write down ideas about the future of a company using a data warehouse.
- I talk to a partner about my findings.

☐	☐

Target Words

- **data warehouse** (noun): a database designed for analysis of data
e.g. A data warehouse is a database designed for analysis, not for real-time business operations.
- **main** (adjective): most important
e.g. Do you know what its main features are? I ought to get informed about it.
- **manager** (noun): a person in charge of a business
e.g. Remember, a data houseware helps managers make decisions
- **hidden** (adjective): not visible
e.g. The third one is data mining; it can discover knowledge by finding hidden patterns.
- **collect** (verb): to obtain many ideas about something
e.g. All information I've collected is going to help me understand if this is the solution our boss is looking for.

Learning Points

The Future With the Present Simple - Interrogative Form

The **present simple** tense does not always refer to the present time. You can also use it to talk about the future.

The **present simple** tense can also have a future connotation as it can refer to events that are scheduled or timetabled in the **future**. In order to change its connotation of time, we have to add a time expression right next to the sentence we write in **present simple**. As you are referring to specific events in a specific moment in the **future**, the time expressions that you use have to be as precise as possible; thus, expressions like *tonight at 9 o'clock*, *in half an hour*, or *tomorrow at 6 pm* are needed.

To make questions about the future using the **present simple**, use the following structures:

(Wh-) + **Do / Does** + Subject + **Verb in base form** + **Complement** ?

Example:

*What time **does** the software supplier office **open tomorrow**?*

(Wh-) + **Be** + Subject + **Complement**?

Example:

***Is** the data warehouse **available after 5 pm**?*

Examples

- *Does the meeting start at 8:30?*
- *Does the boss leave in the afternoon?*

What is a data warehouse?

Most companies have a data warehouse that helps to analyze information for making managerial decisions in the short and long term.

A data warehouse is designed for analysis of business measures by categories and attributes; it is also optimized for bulk loads and large, complex, unpredictable queries that access many rows per table. A data warehouse is loaded with consistent, valid data, so it requires no real-time validation. Opposed to regular databases, a data warehouse supports few concurrent users.
